

What are the lengths of the stock 2010+ Chevrolet Camaro rear axles? Can you make custom length axles?

Yes, we can make custom length rear axles for the 2010+ Chevy Camaro. Custom length rear axle builds have a \$75.00 additional charge over the standard price of our axle packages.

The stock rear axle lengths in their middle (at rest) position, measured stub end to stub end are:

Driver's Side: 35.375"

Passenger's Side: 33.50"

For custom length axles we need on car measurements. With the car at RIDE HEIGHT measure from the seal on the side of the differential to the inside edge of the bearing race where the axle attaches to the spindle. Get a measurement for the driver's and passenger's side.

Fitment Note: Changing the length of the axles requires changing the length of the suspension components as well (trailing arms, toe links, lower control arms and upper control arms).

There are NO RETURNS on custom length axles. They will be built to the measurements you supplied as explained above, once they are ordered, you own them.
